

HermanMiller Healthcare Compass System

The System Designed for Change

The perfect healthcare space today will not be perfect tomorrow. Healthcare organizations face an ongoing challenge in managing their facilities: while treatment and care processes continually evolve, many healthcare spaces are not designed to adapt.

Compass helps navigate change. A system of interchangeable components for hospital and outpatient facilities, Compass creates applications for patient rooms, exam rooms, caregiver work areas, and other clinical spaces.

Flexibility

Designed for change. Compass components are easily assembled, removed, rearranged, and refreshed. Storage can be quickly relocated, headwall utilities can be easily accessed, added, or modified, and damaged product can be easily replaced without demolition.

The result is unmatched flexibility.

Designed for Healthcare

Tiles and components are wrapped in Durawrap, a 99.9% PVC-free material that requires no edge banding, resulting in a seamless, cleanable, and durable surface. A shingled seam between tiles and components prevents spills from seeping in gaps and eliminates the spread of infection. Compass meets the rigorous cleaning requirements of healthcare environments.

The design of Compass allows nurses and other clinical staff to easily make real-time changes to the patient room environment in response to changes in supply storage, patient acuity, or EMR introduction.

Considerate of all

The overall experience of a Compass environment: a space that's well designed, intuitively organized, and inherently satisfying for everyone who uses it.

Aesthetics were an important design consideration. Architects and designers can easily execute their design vision. Compass is available in a range of finishes that integrates into traditional and contemporary settings.

Intelligent Infrastructure

Compass accommodates the utility needs of healthcare environments. Its intelligent infrastructure manages utilities whether pre-piped/pre-wired, stubbed out, or chased from the ceiling.

The infrastructure was engineered to accommodate imperfections in construction by allowing the system to be leveled so when walls are not flat or plumb, the final solution looks perfect.

Long-term Value

Intelligent design and efficient installation make the purchase price affordable. Unmatched flexibility minimizes life-cycle costs and delivers great value over time.

To manage inevitable damage and wear-and-tear, Compass' design and rail system make it easy to swap out modules whether it's a single tile or an entire wall.
